# SUBSTITUTED PYRIDINE AND PYRIDAZINE COMPOUNDS AND THEIR PHARMACEUTICAL USE

### BACKGROUND OF THE INVENTION

5 The present invention comprises a new class of substituted pyridine and pyridazine compounds useful in treating diseases, such as TNF- $\alpha$ , IL-1 $\beta$ , IL-6 and/or IL-8 mediated diseases and other maladies, such as pain, cancer, and diabetes. In particular, the compounds of the invention are useful for the prophylaxis and treatment of diseases or conditions involving inflammation. This invention also relates to intermediates and processes useful in the preparation of such compounds.

Interleukin-1 (IL-1) and Tumor Necrosis Factor  $\alpha$  (TNF- $\alpha$ ) are pro-inflammatory cytokines secreted by a variety of cells, including monocytes and macrophages, in response to many inflammatory stimuli (e.g., lipopolysaccharide - LPS) or external cellular stress (e.g., osmotic shock and peroxide).

15

20

25

30

35

Elevated levels of TNF- $\alpha$  and/or IL-1 over basal levels have been implicated in mediating or exacerbating a number of disease states including rheumatoid arthritis; Pagets disease; osteophorosis; multiple myeloma; uveititis; acute and chronic myelogenous leukemia; pancreatic & cell destruction; osteoarthritis; rheumatoid spondylitis; gouty arthritis; inflammatory bowel disease; adult respiratory distress syndrome (ARDS); psoriasis; Crohn's disease; allergic rhinitis; ulcerative colitis; anaphylaxis; contact dermatitis; asthma; muscle degeneration; cachexia; Reiter's syndrome; type I and type II diabetes; bone resorption diseases; graft vs. host reaction; ischemia reperfusion injury; atherosclerosis; brain trauma; multiple sclerosis; cerebral malaria; sepsis; septic shock; toxic shock syndrome; fever, and myalgias due to infection.

HIV-1, HIV-2, HIV-3, cytomegalovirus (CMV), influenza, adenovirus, the herpes viruses (including HSV-1, HSV-2), and herpes zoster are also exacerbated by TNF- $\alpha$ .

It has been reported that TNF- $\alpha$  plays a role in head trauma, stroke, and ischemia. For instance, in animal models of head trauma (rat), TNF- $\alpha$  levels increased in the contused hemisphere (Shohami et al., J. Cereb. Blood Flow Metab. 14, 615 (1994)). In a rat model of ischemia wherein the middle cerebral artery was occluded, the levels of TNF- $\alpha$  mRNA of TNF- $\alpha$  increased 10 (Feurstein et al., Neurosci. Lett. 164, 125 (1993)). Administration of TNF- $\alpha$  into the rat cortex has been reported to result in significant neutrophil accumulation in capillaries and adherence in small blood vessels. TNF- $\alpha$  promotes the infiltration of other 15 cytokines (IL-1 $\beta$ , IL-6) and also chemokines, which promote neutrophil infiltration into the infarct area (Feurstein, Stroke 25, 1481 (1994)). TNF- $\alpha$  has also been implicated to play a role in type II diabetes (Endocrinol. 130, 43-52, 1994; and Endocrinol. 136, 20 1474-1481, 1995).

TNF-α appears to play a role in promoting certain viral life cycles and disease states associated with them. For instance, TNF-α secreted by monocytes induced elevated levels of HIV expression in a chronically infected T cell clone (Clouse et al., J. Immunol. 142, 431 (1989)). Lahdevirta et al., (Am. J. Med. 85, 289 (1988)) discussed the role of TNF-α in the HIV associated states of cachexia and muscle degradation.

25

TNF-α is upstream in the cytokine cascade of inflammation. As a result, elevated levels of TNF-α may lead to elevated levels of other inflammatory and proinflammatory cytokines, such as IL-1, IL-6, and IL-8.

Elevated levels of IL-1 over basal levels have been implicated in mediating or exacerbating a number of

disease states including rheumatoid arthritis; osteoarthritis; rheumatoid spondylitis; gouty arthritis; inflammatory bowel disease; adult respiratory distress syndrome (ARDS); psoriasis; Crohn's disease; ulcerative colitis; anaphylaxis; muscle degeneration; cachexia; Reiter's syndrome; type I and type II diabetes; bone resorption diseases; ischemia reperfusion injury; atherosclerosis; brain trauma; multiple sclerosis; sepsis; septic shock; and toxic shock syndrome. Viruses sensitive to TNF-α inhibition, e.g., HIV-1, HIV-2, HIV-3, are also affected by IL-1.

TNF-α and IL-1 appear to play a role in pancreatic ß cell destruction and diabetes. Pancreatic ß cells produce insulin which helps mediate blood glucose homeostasis. Deterioration of pancreatic & cells often 15 accompanies type I diabetes. Pancreatic & cell functional abnormalities may occur in patients with type II diabetes. Type II diabetes is characterized by a functional resistance to insulin. Further, type II diabetes is also often accompanied by elevated levels of 20 plasma glucagon and increased rates of hepatic glucose production. Glucagon is a regulatory hormone that attenuates liver gluconeogenesis inhibition by insulin. Glucagon receptors have been found in the liver, kidney and adipose tissue. Thus glucagon antagonists are 25 useful for attenuating plasma glucose levels (WO 97/16442, incorporated herein by reference in its entirety). By antagonizing the glucagon receptors, it is thought that insulin responsiveness in the liver will improve, thereby decreasing gluconeogenesis and lowering 30 the rate of hepatic glucose production.

In rheumatoid arthritis models in animals, multiple intra-articular injections of IL-1 have led to an acute and destructive form of arthritis (Chandrasekhar et al., Clinical Immunol Immunopathol. 55, 382 (1990)). In studies using cultured rheumatoid synovial cells, IL-1 is a more potent inducer of stromelysin than is  $TNF-\alpha$ 

(Firestein, Am. J. Pathol. 140, 1309 (1992)). At sites of local injection, neutrophil, lymphocyte, and monocyte emigration has been observed. The emigration is attributed to the induction of chemokines (e.g., IL-8), and the up-regulation of adhesion molecules (Dinarello, Eur. Cytokine Netw. 5, 517-531 (1994)).

IL-1 also appears to play a role in promoting certain viral life cycles. For example, cytokineinduced increase of HIV expression in a chronically infected macrophage line has been associated with a concomitant and selective increase in IL-1 production (Folks et al., J. Immunol. 136, 40 (1986)). Beutler et al. (J. Immunol. 135, 3969 (1985)) discussed the role of IL-1 in cachexia. Baracos et al. (New Eng. J. Med. 308, 553 (1983)) discussed the role of IL-1 in muscle degeneration.

10

15

25

In rheumatoid arthritis, both IL-1 and TNF- $\alpha$  induce synoviocytes and chondrocytes to produce collagenase and neutral proteases, which leads to tissue destruction 20 within the arthritic joints. In a model of arthritis (collagen-induced arthritis (CIA) in rats and mice), intra-articular administration of TNF- $\alpha$  either prior to or after the induction of CIA led to an accelerated onset of arthritis and a more severe course of the disease (Brahn et al., Lymphokine Cytokine Res. 11, 253 (1992); and Cooper, Clin. Exp. Immunol. 898, 244 (1992)).

IL-8 has been implicated in exacerbating and/or causing many disease states in which massive neutrophil infiltration into sites of inflammation or injury (e.g., ischemia) is mediated by the chemotactic nature of IL-8, including, but not limited to, the following: asthma, inflammatory bowel disease, psoriasis, adult respiratory distress syndrome, cardiac and renal reperfusion injury, thrombosis and glomerulonephritis. In addition to the chemotaxis effect on neutrophils, IL-8 also has the

ability to activate neutrophils. Thus, reduction in IL-8 levels may lead to diminished neutrophil infiltration.

Several approaches have been taken to block the effect of TNF- $\alpha$ . One approach involves using soluble receptors for TNF- $\alpha$  (e.g., TNFR-55 or TNFR-75), which have demonstrated efficacy in animal models of TNF- $\alpha$ -mediated disease states. A second approach to neutralizing TNF- $\alpha$  using a monoclonal antibody specific to TNF- $\alpha$ , cA2, has demonstrated improvement in swollen joint count in a Phase II human trial of rheumatoid arthritis (Feldmann et al., Immunological Reviews, pp. 195-223 (1995)). These approaches block the effects of TNF- $\alpha$  and IL-1 by either protein sequestration or receptor antagonism.

GB 2,306,108, which is incorporated herein by 15 reference in its entirety, describes imidazole derivatives which are Raf kinase antagonists useful in the treatment of cancer which is mediated by Raf and Raf-inducable proteins. Raf proteins are kinases activated in response to extracellular mitogenic stimuli 20 such as PDGF, EGF, acidic FGF, thrombin, insulin or endothelin, and also in response to oncoproteins such as v-src, v-sis, and v-fms. Raf functions downstream of ras in signal transduction from the cellular membrane to the nucleus. Compounds may be oncolytics through the 25 antagonism of Raf kinase. It has been reported that antisense constructs which reduce cellular levels of c-Raf and hence Raf activity inhibit the growth of rodent fibroblasts in soft agar, while exhibiting little or no general cytotoxicity. This inhibition of growth in soft 30 agar is highly predictive of tumor responsiveness in whole animals. Moreover, Raf antisense constructs have shown efficacy in reducing tumor burden in animals. Examples of cancers where Raf kinase is implicated by overexpression include cancers of the brain, larynx, 35 lung, lymphatic system, urinary tract and stomach,

including hystocytic lymphoma, lung adenocarcinoma and small cell lung cancers. Other examples include cancers involving overexpression of upstream activators of Raf or Raf-activating oncogenes, including pancreatic and breast carcinoma.

GB 1,238,959 describes 3- or 4-(hetero)aryl substituted pyridine and pyridone compounds useful in the treatment of inflammation.

WO 98/03484 describes 2-(substituted phenyl or pyridinyl)-3-(4-(methylsulfonyl, aminosulfonyl, trifluorocarbonylaminosulfonyl or methylaminosulfonyl) phenyl-pyridine compounds useful in the treatment of COX-2 mediated diseases.

WO 96/24584 describes 2,3-di(hetero)aryl substituted pyridine compounds, wherein one of such (hetero)aryl substitutents is a phenyl radical substituted with an alkylsulfonyl, aminosulfonyl or haloalkylsulfonyl radical, useful as anti-inflammatory, analgesic and antipyretic agents.

When compounds of the invention include an acidic function such as a carboxy group, then suitable pharmaceutically acceptable cation pairs for the carboxy group are well known to those skilled in the art and include alkaline, alkaline earth, ammonium, quaternary ammonium cations and the like. For additional examples of "pharmacologically acceptable salts," see infra and Berge et al, J. Pharm. Sci. 66, 1 (1977).

"Protecting group" generally refers to groups well known in the art which are used to prevent selected reactive groups, such as carboxy, amino, hydroxy, mercapto and the 25 like, from undergoing undesired reactions, such as nucleophilic, electrophilic, oxidation, reduction and the like. Preferred protecting groups are indicated herein where appropriate. Examples of amino protecting groups include, but are not limited to, aralkyl, substituted 30 aralkyl, cycloalkenylalkyl and substituted cycloalkenyl alkyl, allyl, substituted allyl, acyl, alkoxycarbonyl, aralkoxycarbonyl, silyl and the like. butyl.

Silyl protecting groups are silicon atoms optionally substituted by one or more alkyl, aryl and aralkyl groups. Suitable silyl protecting groups include, but are not limited to, trimethylsilyl, triethylsilyl, tri-isopropylsilyl, tert-butyldimethylsilyl, dimethylphenylsilyl, 1,2-bis(dimethylsilyl)benzene, 1,2-bis(dimethylsilyl)ethane

amino protecting groups are also suitable for protecting

carboxy, hydroxy and mercapto groups. For example, aralkyl groups. Alkyl groups are also sutiable groups for protecting hydroxy and mercapto groups, such as tert-

and diphenylmethylsilyl. Silylation of an amino groups provide mono- or di-silylamino groups. Silylation of aminoalcohol compounds can lead to a N,N,O-tri-silyl derivative. Removal of the silyl function from a silyl ether function is readily accomplished by treatment with, for example, a metal hydroxide or ammonium flouride reagent, either as a discrete reaction step or in situ during a reaction with the alcohol group. Suitable silylating agents are, for example, trimethylsilyl chloride, tert-buty-dimethylsilyl 10 chloride, phenyldimethylsilyl chloride, diphenylmethyl silyl chloride or their combination products with imidazole or DMF. Methods for silylation of amines and removal of silyl protecting groups are well known to those skilled in the art. Methods of preparation of 15 these amine derivatives from corresponding amino acids, amino acid amides or amino acid esters are also well known to those skilled in the art of organic chemistry including amino acid/amino acid ester or aminoalcohol 20 chemistry.

Protecting groups are removed under conditions which will not affect the remaining portion of the molecule. These methods are well known in the art and include acid hydrolysis, hydrogenolysis and the like. A preferred method involves removal of a protecting group, such as removal of a benzyloxycarbonyl group by hydrogenolysis utilizing palladium on carbon in a suitable solvent system such as an alcohol, acetic acid, and the like or mixtures thereof. A t-butoxycarbonyl protecting group can be removed utilizing an inorganic or organic acid, such as HCl or trifluoroacetic acid, in a suitable solvent system, such as dioxane or methylene chloride. The resulting amino salt can readily be neutralized to yield the free amine. Carboxy protecting group, such as methyl, ethyl, benzyl, tert-butyl, 4methoxyphenylmethyl and the like, can be removed under

25

30

hydroylsis and hydrogenolysis conditions well known to those skilled in the art.

Compounds according to the invention can be synthesized according to one or more of the following methods. It should be noted that the general procedures are shown as it relates to preparation of compounds having unspecified stereochemistry. However, such procedures are generally applicable to those compounds 10 of a specific stereochemistry, e.g., where the stereochemistry about a group is (S) or (R). In addition, the compounds having one stereochemistry (e.g., (R)) can often be utilized to produce those having opposite stereochemistry (i.e., (S)) using wellknown methods, for example, by inversion.

The invention relates to substituted pyridines or pyridazines which are useful for the treatment of inflammtory disease and diseases in which IL-1 and TNF play a role. Substituted pyridines and pyridazines embodied in the current invention may be prepared as described in the following schemes and synthetic examples.

Pyridines of Formula I wherein X = C-H and J = Nmay be prepared utilizing the chemistry outlined in Schemes 1 through 3. As shown in Scheme 1, The R<sub>12</sub> and R11 substituents are conveniently introduced from the alcohol and aldehyde precursors to provide dione III. 3,4-substituted pyridones <u>VIIIa</u> and <u>VIIIb</u> may be prepared from cyclopentenones  $\underline{IV}$  and  $\underline{V}$ , respectively, via Beckmann rearrangement and acetate elimination on the intermediate oximes (one isomer represented by VII).

Pyridones <u>VIIIa</u> and <u>VIIIb</u> may be further modified by reaction with POCl, or SO<sub>2</sub>Cl<sub>2</sub>, as shown in Scheme 2, to form the intermediate 2-chloropyridine which can be used in a variety of displacement reactions with HNR5R21, or HOR21, or HSR21 in the presence or absence of base at temperatures from 25°C to 250°C, or carbon bound substituents may be introduced using palladium or nickel catalyzed cross coupling reactions with aryl or alkyl boronic acids, aryl or alkyl stannanes, or aryl or alkyl zinc halides to form compounds of Formula I.

Intermediate 2-chloropyridines may be converted to 2-bromopyridines, which are more preferable as partners in palladium or nickel catalyzed cross coupling reactions, by reaction with HBr in HOAc. Furthermore, pyridones VIIIa and VIIIb may be alkylated with an alkyl halide, mesylate, tosylate or the like, in the presence or absence of base, or may be alkylated with an alcohol under Mitsunobu conditions ( $Ph_3P$ , dialkylazodicarboxylate) to provide compounds of Formula I wherein X = C-H, J = N, and W = -OR21.

An alternative general route to compounds of formula I wherein X = C-H and J = N is shown in Scheme 15 4-substituted pyridine IX can be converted to the N oxide X by reaction with an oxidizing agent such as peroxides, peracids, or oxone, followed by treatment with POCl, to afford XI. Treatment of XI with an amine, alcohol, or sulfide in the presence or absence of a base 20 at a temperature from 25°C to 250°C affords XII which is subsequently halogenated by treatment with an appropriate halogenating reagent such as Br, to afford Introduction of an R11 or R12 substituent to XIII may be performed as shown, utilizing an aryl or 25 heteroaryl or "N"-heteroaryl boronic acid, or alternatively, utilizing a corresponding stannane or corresponding zinc halide in the presence of an appropriate palladium or nickel catalyst in an aprotic 30 solvent to provide XIV.

Pyridines of Formula I, wherein X = N and  $J = C-R_1$  may be prepared as described in shown in Schemes 4-6. As shown in Scheme 4, 2, 6-disubstituted pyridines XVII may be prepared from 2, 6-dibromopyridine XV via a metal catalyzed cross coupling reaction with an appropriate coupling partner and displacement with an appropriate nucleophile.

Another method of preparing intermediate XVII is shown in Scheme 5. The cuprate derived from bromide, IXX, is reacted with N-ethoxycarbonylpyridinium chloride to provide an intermediate dihydropyridine which is oxidized in the presence of O, affording XX.

Debenzylation, and reaction of the intermediate pyridone with POCl, provides 2-chloropyridine XXI, which may may be converted to XVII as described above and shown in the Scheme.

Elaboration of 2,6-disubstitutedpyridines XVII to provide compounds of Formula I wherein X = N, and J = C-R1 is shown in Scheme 6. Bromination of XVII provides an intermediate bromopyridine (not shown) which upon reaction with an aryl or heteroaryl or "N"-heteroaryl boronic acid, or a corresponding organostannane or organozinc halide in the presence of an appropriate palladium or nickel catalyst in an aprotic solvent affords XXII. Introduction of R2 substituents (W = C-R1) may be accomplished by bromination of XXII providing a versatile intermediate, XXIII for the preparation of XXIV. For example, a) aryl or alkyl groups may be introduced by Pd or Ni catalyzed cross coupling reactions with appropriate boronic acids or

organozinc reagents; b) acyl groups are readily introduced by reaction with acid chlorides in the presence of Pd catalysts, and; c) cyano groups may be introduced by the action of CuCN in pyridine.

A widely applicable method for the preparation of pyridazines involves the condensation of a 1,4-dicarbonyl compound with hydrazine (Scheme 9). An oxidative step is required to give the aromatic pyridazine unless the carbonyl component is unsaturated.

#### Scheme 9

Thus, a 4-keto carbonic acid or - ester may be reacted with hydrazine to give a dihydropyridazinone which may be dehydrogenated by a bromination-dehydrobromination step or by using sodium 3-nitrobenzenesulfonate as an oxidant (Scheme 10) (e.g. Th. Curtius, J. Prakt. Chem. 50, 509, 1894; Gabriel and Colman, Chem. Ber. 32,395, 1899; D. Libermann and A. Rouaix, Bull. Soc. Chim. Fr. 117, 1959; E. Ravina et al., Arch. Pharm. (Weinheim) 324, 455, 1991).

This approach allows the preparation of 5,6-disubstituted 2H-pyridazin-3-ones by using the corresponding 3,4-disubstituted 4-keto butyric acid or ester as demonstrated in Scheme 11 (Almstroem, Just. Lieb. Ann. Chem. 400, 137, 1913; E. Ravina et al., Eur. J. Med. Chem.-Chim. Ther.20, 475, 1985; E. Ravina et al., Arch. Pharm. (Weinheim), 324, 455, 1991):

In a related approach (Scheme 12) that does not require an oxidation step, glyoxylic acid may be reacted

with a methylen ketone in a thermic condensation reaction to give a disubstituted 5-hydroxy-2(5H)-furanone. Reaction of this intermediate with hydrazine then may lead directly to the disubstituted pyridazinone (C.-G. Wermuth et al., J.Med.Chem. 30, 239, 1987):

### Scheme 12

2H-Pyridazin-3-ones can easily be converted into 3chloropyridazines (Scheme 13) by treatment with e.g.
phosphorus oxychloride at elevated temperature (e.g.
Gabriel and Colman, Chem. Ber. 32,395, 1899; D.

intermediate for nucleophilic substitution reactions
with e.g. primary or secondary amines (e.g. E. Ravina,
Arch. Pharm. (Weinheim) 324, 455 (1991)).

# Lipopolysaccharide-activated monocyte TNF production assay

25 Isolation of monocytes

5

Test compounds were evaluated in vitro for the ability to inhibit the production of TNF by monocytes activated with bacterial lipopolysaccharide (LPS).

Fresh residual source leukocytes (a byproduct of plateletpheresis) were obtained from a local blood bank,

114

and peripheral blood mononuclear cells (PBMCs) were isolated by density gradient centrifugation on Ficol-Paque Plus (Pharmacia). PBMCs were suspended at 2 x 106/ml in DMEM supplemented to contain 2% FCS, 10 mM, 0.3 mg/ml glutamate, 100 U/ml penicillin G and 100 mg/ml streptomycin sulfate (complete media). Cells were plated into Falcon flat bottom, 96 well culture plates (200 µl/well) and cultured overnight at 37°C and 6% CO<sub>2</sub>. Non-adherent cells were removed by washing with 200 µl/well of fresh medium. Wells containing adherent cells (~70% monocytes) were replenished with 100 µl of fresh medium.

Preparation of test compound stock solutions

Test compounds were dissolved in DMZ. Compound stock solutions were prepared to an initial concentration of 10 - 50 µM. Stocks were diluted initially to 20 - 200 µM in complete media. Nine two-fold serial dilutions of each compound were then prepared in complete medium.

20 Treatment of cells with test compounds and activation of TNF production with lipopolysaccharide

One hundred microliters of each test compound dilution were added to microtiter wells containing adherent monocytes and 100 µl complete medium.

Monocytes were cultured with test compounds for 60 min at which time 25 µl of complete medium containing 30 ng/ml lipopolysaccharide from E. coli K532 were added to each well. Cells were cultured an additional 4 hrs. Culture supernatants were then removed and TNF presence in the supernatants was quantified using an ELISA.

#### TNF ELISA

15

Flat bottom, 96 well Corning High Binding ELISA plates were coated overnight (4°C) with 150  $\mu$ L/well of 3  $\mu$ g/ml murine anti-human TNF- $\alpha$  MAb (R&D Systems #MAB210). Wells were then blocked for 1 hr at room temperature with 200  $\mu$ L/well of CaCl<sub>2</sub>-free ELISA buffer supplemented

115

to contain 20 mg/ml BSA (standard ELISA buffer: 20 mM, 150 mM NaCl, 2 mM CaCl,, 0.15 mM thimerosal, pH 7.4). Plates were washed and replenished with 100  $\mu$ l of test supernatants (diluted 1:3) or standards. Standards consisted of eleven 1.5-fold serial dilutions from a stock of 1 ng/ml recombinant human TNF (R&D Systems). Plates were incubated at room temperature for 1 hr on orbital shaker (300 rpm), washed and replenished with 100  $\mu$ l/well of 0.5  $\mu$ g/ml goat anti-human TNF- $\alpha$  (R&D systems #AB-210-NA) biotinylated at a 4:1 ratio. Plates 10 were incubated for 40 min, washed and replenished with 100 µl/well of alkaline phosphatase-conjugated streptavidin (Jackson ImmunoResearch #016-050-084) at 0.02 µg/ml. Plates were incubated 30 min, washed and 15 replenished with 200 µl/well of 1 mg/ml of p-nitrophenyl phosphate. After 30 min, plates were read at 405 nm on a V plate reader.

Data analysis

30

Standard curve data were fit to a second order

20 polynomial and unknown TNF-α concentrations determined
from their OD by solving this equation for
concentration. TNF concentrations were then plotted vs.
test compound concentration using a second order
polynomial. This equation was then used to calculate

25 the concentration of test compounds causing a 50%
reduction in TNF production.

Compounds of the invention can also be shown to inhibit LPS-induced release of IL-1 $\beta$ , IL-6 and/or IL-8 from monocytes by measuring concentrations of IL-1 $\beta$ , IL-6 and/or IL-8 by methods well known to those skilled in the art. In a similar manner to the above described assay involving the LPS induced release of TNF- $\alpha$  from monocytes, compounds of this invention can also be shown to inhibit LPS induced release of IL-1 $\beta$ , IL-6 and/or IL-

35 8 from monocytes by measuring concentrations of  $IL-1\beta$ ,

IL-6 and/or IL-8 by methods well known to those skilled in the art. Thus, the compounds of the invention may lower elevated levels of TNF- $\alpha$ , IL-1, IL-6, and IL-8 levels. Reducing elevated levels of these inflammatory cytokines to basal levels or below is favorable in controlling, slowing progression, and alleviating many disease states. All of the compounds are useful in the methods of treating disease states in which TNF- $\alpha$ , IL-1 $\beta$ , IL-6, and IL-8 play a role to the full extent of the definition of TNF- $\alpha$ -mediated diseases described herein.

- 10 1. Remove media from confluent flask then rinse once each with PBS (Ca, Mg-free) and Enzyme-free Dissociation Fluid (Specialty Media, Inc.).
  - 2. Add 10 ml Enzyme-free Dissoc. Fluid and hold for about 4 min. at 37°C.
- 3. Gently tap cells free, triturate, take aliquot for counting and centrifuge remainder for 5 min. at 1000 rpm.

The mixture is incubated for 60 min. at 22°C on a shaker at 275 rpm. The mixture is filtered over pre-soaked (0.5% polyethylimine (PEI)) GF/C filtermat using an Innotech Harvester or Tomtec Harvester with four washes of ice-cold 20mM Tris buffer (pH 7.8). The radioactivity in the filters is determined by a gammascintillation counter.

10 Thus, compounds of the invention may also be shown to inhibit the binding of glucagon to glucagon receptors.

#### Cyclooxygenase Enzyme Activity Assay

The human monocytic leukemia cell line, THP-1, differentiated by exposure to phorbol esters expresses only COX-1; the human osteosarcoma cell line 143B expresses predominantly COX-2. THP-1 cells are routinely cultured in RPMI complete media supplemented 20 with 10% FBS and human osteosarcoma cells (HOSC) are cultured in minimal essential media supplemented with 10% fetal bovine serum (MEM-10%FBS); all cell incubations are at 37°C in a humidified environment containing 5% CO,.

COX-1 Assay

15

25

30

In preparation for the COX-1 assay, THP-1 cells are grown to confluency, split 1:3 into RPMI containing 2% FBS and 10 mM phorbol 12-myristate 13-acetate (TPA), and incubated for 48 hours on a shaker to prevent attachment. Cells are pelleted and resuspended in Hank's Buffered Saline (HBS) at a concentration of 2.5 × 10° cells/mL and plated in 96-well culture plates at a density of 5 × 10° cells/mL. Test compounds are diluted

122

in HBS and added to the desired final concentration and the cells are incubated for an additional 4 hours. Arachidonic acid is added to a final concentration of 30 mM, the cells incubated for 20 minutes at 37°C, and enzyme activity determined as described below.

#### COX-2 Assay

5

30

35

For the COX-2 assay, subconfluent HOSC are trypsinized and resuspended at 3 × 10° cells/mL in MEM-FBS containing 1 ng human IL-lb/mL, plated in 96-well 10 tissue culture plates at a density of 3 × 104 cells per well, incubated on a shaker for 1 hour to evenly distribute cells, followed by an additional 2 hour static incubation to allow attachment. The media is then replaced with MEM containing 2% FBS (MEM-2%FBS) and 15 1 ng human IL-1b/mL, and the cells incubated for 18-22 hours. Following replacement of media with 190 mL MEM, 10 mL of test compound diluted in HBS is added to achieve the desired concentration and the cells incubated for 4 hours. The supernatants are removed and 20 replaced with MEM containing 30 mM arachidonic acid, the cells incubated for 20 minutes at 37°C, and enzyme activity determined as described below.

#### 25 COX Activity Determined

After incubation with arachidonic acid, the reactions are stopped by the addition of 1 N HCl, followed by neutralization with 1 N NaOH and centrifugation to pellet cell debris. Cyclooxygenase enzyme activity in both HOSC and THP-1 cell supernatants is determined by measuring the concentration of PGE, using a commercially available ELISA (Neogen #404110). A standard curve of PGE, is used for calibration, and commercially available COX-1 and COX-2 inhibitors are included as standard controls.

123

#### Raf Kinase assay

In vitro Raf kinase activity is measured by the extent of phosphorylation of the substrate MEK (Map kinase/ERK kinase) by activated Raf kinase, as described in GB 1,238,959 (incorporated herein by reference in its entirety). Phosphorylated MEK is trapped on a filter and incorporation of radiolabeled phosphate is quantified by scintillation counting.

#### 10 MATERIALS:

Activated Raf is produced by triple transfection of Sf9 cells with baculoviruses expressing "Glu-Glu"-epitope tagged Raf, val<sup>12</sup>-H-Ras, and Lck. The "Glu-Glu"-epitope, Glu-Try-Met-Pro-Met-Glu, was fused to the carboxy-

- terminus of full length c-Raf.

  <u>Catalytically inactive MEK</u> (K97A mutation) is produced in Sf9 cells transfected with a baculovirus expressing c-terminus "Glu-Glu" epitope-tagged K97A MEK1.
  - Anti "Glu-Glu" antibody was purified from cells grown as

- of benzamidine, leupeptin, pepstatin, and aprotinin.

  5x Reaction buffer: 125 mM HEPES pH=8, 25 mM MgCl, 5

pp 2922-2926, 1992. All subsequent steps were preformed on ice or at 4°C. Cells were pelleted and lysed by sonication in column buffer. Lysates were spun at 17,000xg for 20 min, followed by 0.22  $\mu m$  filtration. Epitope tagged proteins were purified by chromatography over GammaBind Plus affinity column to which the "Glu-Glu" antibody was coupled. Raf kinase assay: Test compounds were evaluated using ten 3-fold serial dilutions starting at 10 - 100  $\mu M$ . 10 μL of the test inhibitor or control, dissolved in 10% DMSO, was added to the assay plate followed by the addition of 30 µL of the a mixture containing 10 µL 5x reaction buffer, lmM  $^{33}\text{P-}\gamma\text{-ATP}$  (20  $\mu\text{Ci/mL}$ ), 0.5  $\mu\text{L}$  MEK (2.5 mg/mL), 1  $\mu$ L 50 mM  $\beta$ -mercaptoethanol. The reaction was started by the addition of 10  $\mu L$  of enzyme dilution buffer containing 1 mm DTT and an amount of activated . Raf that produces linear kinetics over the reaction time course. The reaction was mixed and incubated at room temperature for 90 min. and stopped by the addition of 50  $\mu L$  stop solution. 90  $\mu L$  aliquots of this stopped solution were transferred onto GFP-30 cellulose microtiter filter plates (Polyfiltronics), the filter plates washed in four well volumes of 5% phosphoric acid, allowed to dry, and then replenished with 25  $\mu l$ scintillation cocktail. The plates were counted for 33p gamma emission using a TopCount Scintillation Reader.

35

The dosage regimen for treating a TNF-α, IL-1, IL-6, and IL-8 mediated diseases, cancer, and/or hyperglycemia with the compounds of this invention and/or compositions of this invention is based on a variety of factors, including the type of disease, the

129

age, weight, sex, medical condition of the patient, the severity of the condition, the route of administration, and the particular compound employed. Thus, the dosage regimen may vary widely, but can be determined routinely using standard methods. Dosage levels of the order from about 0.01 mg to 30 mg per kilogram of body weight per day, preferably from about 0.1 mg to 10 mg/kg, more preferably from about 0.25 mg to 1 mg/kg are useful for all methods of use disclosed herein.

The pharmaceutically active compounds of this invention can be processed in accordance with conventional methods of pharmacy to produce medicinal agents for administration to patients, including humans and other mammals.

For oral administration, the pharmaceutical composition may be in the form of, for example, a capsule, a tablet, a suspension, or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a given amount of the active ingredient. For example, these may contain an amount of active ingredient from about 1 to 2000 mg, preferably from about 1 to 500 mg, more preferably from about 5 to 150 mg. A suitable daily dose for a human or other mammal may vary widely depending on the condition of the patient and other factors, but, once again, can be determined using routine methods.

The active ingredient may also be administered by injection as a composition with suitable carriers including saline, dextrose, or water. The daily parenteral dosage regimen will be from about 0.1 to about 30 mg/kg of total body weight, preferably from about 0.1 to about 10 mg/kg, and more preferably from about 0.25 mg to 1 mg/kg.

Injectable preparations, such as sterile injectable aqueous or oleaginous suspensions, may be formulated according to the known are using suitable dispersing or wetting agents and suspending agents. The sterile

130

injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed, including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Suppositories for rectal administration of the drug can be prepared by mixing the drug with a suitable non-irritating excipient such as cocoa butter and polyethylene glycols that are solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum and release the drug.

A suitable topical dose of active ingredient of a compound of the invention is 0.1 mg to 150 mg administered one to four, preferably one or two times daily. For topical administration, the active ingredient may comprise from 0.001% to 10% w/w, e.g., from 1% to 2% by weight of the formulation, although it may comprise as much as 10% w/w, but preferably not more than 5% w/w, and more preferably from 0.1% to 1% of the formulation.

Formulations suitable for topical administration include liquid or semi-liquid preparations suitable for penetration through the skin (e.g., liniments, lotions, ointments, creams, or pastes) and drops suitable for administration to the eye, ear, or nose.

For administration, the compounds of this invention are ordinarily combined with one or more adjuvants appropriate for the indicated route of administration. The compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanoic acids,

131

stearic acid, talc, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulphuric acids, acacia, gelatin, sodium alginate, polyvinylpyrrolidine, and/or polyvinyl alcohol, and tableted or encapsulated for conventional administration. Alternatively, the compounds of this invention may be dissolved in saline, water, polyethylene glycol, propylene glycol, ethanol, corn oil, peanut oil, cottonseed oil, sesame oil, tragacanth gum, and/or various buffers. Other adjuvants and modes of 10 administration are well known in the pharmaceutical art. The carrier or diluent may include time delay material, such as glyceryl monostearate or glyceryl distearate alone or with a wax, or other materials well known in 15 the art.

The pharmaceutical compositions may be made up in a solid form (including granules, powders or suppositories) or in a liquid form (e.g., solutions, suspensions, or emulsions). The pharmaceutical compositions may be subjected to conventional pharmaceutical operations such as sterilization and/or may contain conventional adjuvants, such as preservatives, stabilizers, wetting agents, emulsifiers, buffers etc.

20

35

Solid dosage forms for oral administration may include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound may be admixed with at least one inert diluent such as sucrose, lactose, or starch. Such dosage forms may also comprise, as in normal practice, additional substances other than inert diluents, e.g., lubricating agents such as magnesium stearate. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents. Tablets and pills can additionally be prepared with enteric coatings.

Liquid dosage forms for oral administration may include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs containing

inert diluents commonly used in the art, such as water. Such compositions may also comprise adjuvants, such as wetting, sweetening, flavoring, and perfuming agents.

Compounds of the present invention can possess one or more asymmetric carbon atoms and are thus capable of existing in the form of optical isomers as well as in the form of racemic or non-racemic mixtures thereof. optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes, e.g., by formation of diastereoisomeric salts, by 10 treatment with an optically active acid or base. Examples of appropriate acids are tartaric, diacetyltartaric, dibenzoyltartaric, ditoluoyltartaric, and camphorsulfonic acid and then separation of the mixture of diastereoisomers by crystallization followed 15 by liberation of the optically active bases from these A different process for separation of optical isomers involves the use of a chiral chromatography column optimally chosen to maximize the separation of the enantiomers. Still another available method involves 20 synthesis of covalent diastereoisomeric molecules by reacting compounds of the invention with an optically pure acid in an activated form or an optically pure isocyanate. The synthesized diastereoisomers can be separated by conventional means such as chromatography, 25 distillation, crystallization or sublimation, and then hydrolyzed to deliver the enantiomerically pure compound. The optically active compounds of the invention can likewise be obtained by using active starting materials. These isomers may be in the form of a free acid, a free 30 base, an ester or a salt.

The compounds of the present invention can be used in the form of salts derived from inorganic or organic acids. The salts include, but are not limited to, the following: acetate, adipate, alginate, citrate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate,

35

133

Also, the basic nitrogen-10 containing groups can be quaternized with such agents as lower alkyl halides, such as methyl, ethyl, propyl, and butyl chloride, bromides and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl, and diamyl sulfates, long chain halides such as decyl, lauryl, myristyl and 15 stearyl chlorides, bromides and iodides, aralkyl halides like benzyl and phenethyl bromides, and others. Water or oil-soluble or dispersible products are thereby obtained.

When administered as a combination, the therapeutic agents can be formulated as separate compositions that are given at the same time or different times, or the therapeutic agents can be given as a single composition.

The foregoing is merely illustrative of the invention and is not intended to limit the invention to the disclosed compounds. Variations and changes which are obvious to one skilled in the art are intended to be

Box i Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1. X Claims Nos.: 14-37 because they relate to subject matter not required to be searched by this Authority, namely:  Remark: Although claims 14-37  are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. X Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  See FURTHER INFORMATION sheet PCT/ISA/210
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box il Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)
This International Searching Authority found multiple inventions in this international application, as follows:
As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this international Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark on Protest  The additional search fees were accompanied by the applicant's protest.  No protest accompanied the payment of additional search fees.

# FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

The search revealed such a large number of particularly relevant documents, in particular with regard to novelty, that the drafting of a comprehensive International Search Report is not feasible. The cited documents are considered as to form a representative sample of the revealed documents, duly taking into account their relevance with respect to the subject-matter as illustrated by the examples.
